AI ON THE RISE · PRIVATE AI

Running AI locally on standard hardware changes the equation

It’s not just about speed. It’s about architecture, privacy, and control.

WHAT HAPPENED

Qwen3.8 already runs on a standard PC with Strata

According to the repository, the model can run on Windows or Linux, on NVIDIA or AMD GPUs with 12 GB or more, with a local API compatible with OpenAI and Anthropic. The idea is simple: nothing leaves the PC.

THE NUMBER

12 GB

Minimum VRAM mentioned to run on consumer hardware

The source also mentions 32 GB or more of RAM and a download of around 70 GB.

THE REAL PROBLEM IN COMPANIES

What I see in companies when this lands on the table

01 The pilot works, but no one finalizes the production architecture

02 Privacy becomes an objection because sensitive data leaves the environment

03 Without governance, the agent responds with no auditable trail of the error

I'VE ALREADY SOLVED THIS

Taking this into production has already happened in an enterprise account

01 Multi-agent platform in production in an enterprise account

02 US$ 5.5 million account

03 **Around 60% efficiency gain and audited defect log**

MY TAKE

Simple that works is worth more than complex that impresses.

In practice, this opens room to redesign architecture in companies where privacy, predictable cost, and reliability matter more than a pretty demo. If it’s already possible to run locally with more control, it becomes more viable to put it into production with governance.

WANT TO SEE HOW I DID IT?

Comment AGENTES.

I'll send you the step-by-step of the case in DM. I take AI off the whiteboard and put it into production, with measured results.
