AI ON THE RISE · BLUEPRINTS

Generating a floor plan in minutes doesn't solve the whole project

When AI draws faster, the bottleneck moves somewhere else.

WHAT HAPPENED

A startup says it can generate blueprints ready for approval

According to TechCrunch, Blueprints AI generates code-compliant, permit-ready blueprints in minutes from a 2D sketch or PDF. Version 2 updates the entire project with one change and checks it against local codes.

THE NUMBER

80%

of the time architects spend on drafting, according to the source

The company's proposal is to flip that to 20-80 between drafting and design.

THE REAL PROBLEM IN COMPANIES

What I see in companies when the demo looks impressive

01 Generating output is not enough without validating the technical rules of the real process

02 AI draws, but it doesn't talk to the software that delivers the project

03 Automation gets stuck at the proof of concept and never enters the operational workflow

I'VE ALREADY SOLVED THIS

At Consult Eng, a Brazilian sanitary engineering company

01 Revit automation that generates models of sewage pumping stations

02 The models are generated in Revit, inside the technical software used in the process

03 **Revit running headless, in the cloud, with APS Design Automation**

MY TAKE

Simple that works is worth more than complex that impresses.

In practice, the value in engineering is not just in generating drawings. It is in connecting generation, validation, and delivery inside the workflow the company already runs. If it doesn't enter the technical software and the real routine, it is still just a demo.

WANT TO SEE HOW I DID IT?

Comment REVIT.

I'll send you the step-by-step of the case by DM. I take AI out of the concept stage and put it into production, with measured results.
