AI ON THE RISE · AGENTS IN DEV

The gain does not come from the agent alone

The tool evolves. The engineering workflow needs to evolve with it.

WHAT HAPPENED

OpenCode 2.0 reinforces the idea of the agent as a workflow

The update brought a single local service, a rebuilt API, background subagents, asynchronous commands, 80+ plugins and an SDK. In parallel, AI-DLC proposes verifiable workflows for code agents across multiple harnesses.

THE NUMBER

33

stages in the AI-DLC cycle

The idea is to connect requirements, implementation, review and operations.

THE REAL PROBLEM IN COMPANIES

What I see in companies when agents enter dev

01 They test a new copilot, but keep the same manual workflow

02 The agent writes code, but review and decision-making stay loose

03 A prototype ships fast, but without a clear path to production

I HAVE ALREADY SOLVED THIS

This is how it worked on the AskMoses.AI development team

01 Each dev works with Claude Code in the project

02 Another Claude reviews the pull request

03 **Deploys run on Vercel with 1-click rollback and daily backup**

MY TAKE

Launching is not the same as being used.

In practice, a code agent only changes results when it enters an operable workflow. With review, human business decisions, and a safe deployment path. Without that, it becomes just another quick demo that does not hold up in production.

WANT TO SEE HOW I DID IT?

Comment CLAUDE.

I will send you the case step by step by DM. I take AI out of slides and put it into production, with measured results.
