AI IS BOOMING · CODE REVIEW

AI writing code isn't the bottleneck. Review is.

When agents produce more, review becomes the critical point.

WHAT HAPPENED

Anthropic explained how it does code review in Claude Code

The team describes a layered flow: checks before the PR, review by agents, security review, mandatory CI, human approval based on risk, merge queue, flags, and fast rollback. The idea is to save human time without increasing reverts or incidents.

THE NUMBER

40%

more than a 40% drop in the share of reverted PRs

From June to September, while merged PRs more than doubled.

THE REAL PROBLEM IN COMPANIES

What I see in companies when they try to speed up with AI

01 AI generates more code, but review stays manual and turns into a queue

02 The team automates writing, but doesn't integrate validation into the real workflow

03 Without simple rollback, every speed gain turns into production risk

I'VE ALREADY SOLVED THIS

This is how we did it on the AskMoses.AI development team

01 each dev works with Claude Code on the project

02 another Claude reviews the pull request

03 **deploy on Vercel with 1-click rollback and daily backup**

MY TAKE

Measure instead of assuming.

If AI speeds up writing but increases rework, incidents, or approval wait time, there was no real gain. In this case, the point isn't how many agents write code. It's how much of the flow becomes reliable, auditable, and reversible in production.

WANT TO SEE HOW I DID IT?

Comment CLAUDE.

I'll send you the case step by step by DM. I take AI out of theory and put it into production, with measured results.
