AI ON THE RISE · VOICE IN PRODUCTION

Voice got better. The bottleneck now is the workflow.

When the model gets more right, integrating service becomes the real problem.

WHAT HAPPENED

Mistral launched the Voxtral 3 family with a voice agent SDK

The proposal combines listening, reasoning, tool calling, and speech in a real-time pipeline. According to the source, the focus is on multi-step conversations, with integration into company systems and data.

THE NUMBER

50+

languages supported for transcription

The source also mentions 35+ languages in TTS and 50+ dialects.

THE REAL PROBLEM IN COMPANIES

What I see in companies when they move into voice

01 The conversation works, but it doesn't access the right catalog and context.

02 The AI speaks well, but it doesn't follow commercial rules or operational limits.

03 Without measuring conversion and handoff, voice becomes just a nice demo.

I'VE ALREADY SOLVED THIS

This is what I implemented for a building materials store in southern Brazil

01 13,312 products in the ERP and 136 different ways of writing the unit.

02 245 counter synonyms mapped to translate slang into catalog terms.

03 **65 out of 65 real customer questions found the right product.**

MY TAKE

Measure instead of assuming.

In practice, voice does not generate results just because it transcribes better or sounds more natural. What matters is entering a reliable workflow, with the right tool, the right memory, and a business metric. Without that, the company hears a demo. Not an operation.

WANT TO SEE HOW I DID IT?

Comment SDR.

I'll send you the step-by-step of the case by DM. I take AI off the drawing board and put it into production, with measured results.
