AI ON THE RISE · PERMISSIONS ON MACOS

When the agent gets real access, the risk moves to another level

Apple tightened Full Disk Access controls in macOS because of agent-related risk

WHAT HAPPENED

Apple will add extra controls to Full Disk Access

Apple said some apps use this access in a way that can expose files, emails, messages, and browsing history without the user fully understanding it. And it said that, with more capable and autonomous AI agents, that risk grows substantially.

WHAT CHANGES

The technical message was very clear

01 Full access will require very explicit user action

02 Apple treats this level of access as extraordinary

03 The risk increases as agents become more capable and autonomous

THE REAL PROBLEM IN COMPANIES

What I see in companies when the agent moves past the demo

01 They ask for autonomy before defining who can access what

02 They connect real systems without a clear audit trail

03 They scale the pilot without well-defined operational limits

I'VE ALREADY SOLVED THIS

I've already seen this in an enterprise account

01 Multi-agent platform in production in an enterprise account

02 US$ 5.5 million account

03 **About 60% efficiency gain; audited defect log**

MY TAKE

Launching is not the same as being used.

In practice, an agent in production is not just a model and an interface. It's access control, auditing, and operational limits. Without that, it may work in the pilot. But it doesn't become a reliable operation once it touches systems, sensitive data, and real decisions.

WANT TO SEE HOW I DID IT?

Comment AGENTES.

I'll send you the case step by step in DM. I take AI off the drawing board and put it into production, with measured results.
