AI ON THE RISE · DECISION IN PRODUCTION

An agent that answers doesn't solve business decisions

The new Decisions API formalizes a layer that was missing in production

WHAT HAPPENED

OpenAI put the Decisions API into public beta

The API evaluates text, image, or both and returns typed responses. It's used to classify content, route requests, and prioritize work. According to the documentation, it does this 10x faster than the Responses API.

THE NUMBER

10x

faster than the Responses API

According to OpenAI's documentation for typed decision responses

THE REAL PROBLEM IN COMPANIES

What I see in companies when they try to automate decisions

01 They have an agent answering, but no clear rule for when it should act

02 There’s no observability to understand why the decision went that way

03 Without governance, the automation may run, but it doesn’t become a safe operation

I'VE ALREADY SOLVED THIS

This connects directly to what I built in an enterprise account

01 A multi-agent platform in production in a US$ 5.5 million account

02 Around 60% efficiency gains with the operation in production

03 **Multi-agent in production requires an audited defect log**

MY TAKE

Measure instead of assuming.

When AI starts deciding route, priority, or classification, it’s not enough to look smart. It needs rules, traceability, and a clear accuracy standard. In practice, value comes when the decision enters the operation and the outcome can be measured.

WANT TO SEE HOW I DID IT?

Comment AGENTES.

I'll send you the case step by step in DM. I take AI off the whiteboard and put it into production, with measured results.
