AI ON THE RISE · VOICE AI

Voice AI still fails at the basics that block scale

Without reliable context, it just swaps a fragile chatbot for a fragile callbot

WHAT HAPPENED

Executives say voice still has not had its moment

TechCrunch pulled together similar takes: voice has improved, but it still gets stuck on context, response speed, transcription and trust. Transparency also matters: in corporate calls, it needs to be clear when the person is speaking with AI.

THE NUMBER

6B

people have barely had contact with LLMs, according to Karpathy

The gap between demo, casual use and real production use is still large

THE REAL PROBLEM IN COMPANIES

What I see in companies when they try to get this up and running

01 The voice sounds good, but the AI does not find the right data in time

02 Without a clear rule, the agent answers beyond what it should

03 Without integration and metrics, no one knows whether it solved anything or just answered

I HAVE ALREADY SOLVED THIS

This is how it worked at a construction materials store in Southern Brazil

01 13,312 products in the ERP and 136 different ways to write the unit

02 245 counter synonyms mapped so the customer could find the right item

03 **65 out of 65 real customer questions found the right product**

MY TAKE

Simple that works is worth more than complex that impresses.

In practice, before putting voice into the operation, I would solve context, integration and rules. In the case, the AI does not see the entire catalog: a simple search answers in milliseconds and delivers 8 results to the model. That is what makes production use reliable.

WANT TO SEE HOW I DID IT?

Comment SDR.

I will send you the case step by step by DM. I take AI off the page and put it into production, with measured results.
