AI ON THE RISE · AI BLUEPRINTS

AI can draw a permit-level plan. Can you use it?

A drawing is a demo. An editable, checked design is the product.

WHAT HAPPENED

An architect tested 13 AI models on drafting a house

Stephen Gallagher gave 13 models the same sketches. Claude Opus 5.5 produced a set he judges good enough for a building permit, with his feedback. Models released before September could not draw the floor plans without major errors.

THE NUMBER

15,000

lines of Python code behind Opus 5.5's drawing set

It took twelve hours and a few hundred dollars in compute, per the author.

THE REAL PROBLEM IN COMPANIES

What I see in companies that try AI for technical design

01 A good-looking output gets approved before anyone checks it against the rules

02 The drawing can't be edited, so engineers redo it by hand anyway

03 Nobody owns the review step between the AI output and the final design

I'VE ALREADY SOLVED THIS

Consult Eng, a Brazilian sanitation engineering firm, needed usable models, not demos

01 I built a Revit automation that generates sewage pumping station models

02 Revit runs headless in the cloud through APS Design Automation

03 **The output is a model engineers can open and work with in Revit**

MY TAKE

Simple that works beats complex that impresses.

A model that draws a permit-level plan is impressive. But the real work is making the output editable, rule-compliant and checked against engineering constraints. That is what holds up in production. A pretty drawing nobody can edit is still a demo.

WANT TO SEE HOW I DID IT?

Comment REVIT.

I'll send you the step-by-step of this case by DM. I take AI off the drawing board and put it into production, with measured results.
